📍 **Work:** (Saudi Arabia)

ABOUT ME

DevOps Engineer with a BS in Computer Science and 3 years of experience in cloud infrastructure, Linux server administration (Ubuntu, AlmaLinux, Arch), and VPN deployment and management (WireGuard, OpenVPN, Outline, Marzban, Hiddify). Strong networking expertise including NAT, VLANs, subnetting, and WAN configuration on Cisco devices, with firewall administration across FortiGate, Cisco, and pfSense. Proficient in CI/CD pipelines with Jenkins (Groovy) and GitLab CI, Bash automation, and monitoring with Grafana and custom dashboards.

WORK EXPERIENCE

🏢 **GoCloud Pvt Ltd.** – Pakistan

Associate DevOps Engineer

[2023 – 2026]

- Designed and maintained **CI/CD pipelines** using **Jenkins** (Groovy scripted/declarative pipelines), **GitLab CI**, and **Drone CI**, building custom stages for automated testing, artifact building, and deployment workflows.
- Managed source control across Git, **GitHub**, and GitLab, implementing branching strategies (feature, develop, release branches), pull/merge request workflows, and release management with version tagging.
- Provisioned and managed AWS cloud infrastructure using **Terraform (IaC)**, including EC2, VPC, S3, and IAM resources, with version-controlled and reusable infrastructure modules.
- Automated server configuration and application deployment across multiple environments using **Ansible** playbooks and roles, reducing manual provisioning effort and configuration drift.
- Containerized applications with **Docker**, writing Dockerfiles and managing images, multi-container setups with Docker Compose, and integrating container builds and deployments into CI/CD pipelines.

EDUCATION AND TRAINING

BS Computer Science

Muhammad Nawaz Shareef University of Agriculture, Multan [2020 – 2024]

Website: <https://www.mnsuam.edu.pk/> | Field(s) of study: Computer Networks & Cloud Computing

PROJECTS

Openvpn-Dashboard **OpenVPN Dashboard** is a lightweight, real-time monitoring tool for self-hosted OpenVPN servers. It uses Flask and Server-Sent Events to stream live client connections, bandwidth usage, and system health to a clean, dark-themed web UI. With inotify-based log watching and zero-refresh updates, it delivers instant connection events and per-client data usage. Designed for simplicity, it runs as a single Python app with no heavy frontend frameworks required.

Link: <https://github.com/muazbhutta/openvpn-dashboard>

WG-API WireGuard Peer Generation API is a lightweight REST API that generates a fresh client configuration on each request — new keypair, next free IP, and all server settings parsed live from wg0.conf. It automatically scans existing peers to assign the next available host address and activates the new peer instantly with wg set — no service restart or downtime. Fully compatible with wireguard-manager's header format, it never hardcodes endpoints, DNS,

MTU, or keepalive; everything updates automatically from the server config. Secured with token authentication and running as a systemd service with memory limits, it's ideal for low-resource VPS deployments and automated VPN fleet management.

Link: <https://github.com/muazbhutta/WG-API>

Openvpn-LoadBalancer Python-based load balancer for OpenVPN that distributes VPN client traffic across multiple servers in different regions (USA, UK, Singapore, and Germany). It uses asynchronous programming (asyncio) to handle thousands of UDP connections efficiently in a single process. Clients are assigned to servers using round-robin scheduling with session stickiness, so each user stays connected to the same server. It also performs automatic health checks, removing failed servers from rotation and restoring them once they recover. The entire system is built with zero external dependencies, using only the Python standard library.

Link: https://github.com/muazbhutta/Openvpn_Loadbalancer

Wireguard_Config_Deletion WireGuard Config Deletion is a Python automation script that keeps a WireGuard VPN server clean by removing stale peers. It scans all peers on the wg0 interface and checks each one's last handshake time to detect inactivity. Any peer that has been silent for more than 1 hour — or has never connected at all — is automatically removed from the live interface. The script also deletes the peer's client .conf file from /etc/wireguard/ clients and saves the updated configuration so changes persist across restarts. Built entirely with the Python standard library, it logs every action and is designed to run as a root cron job for hands-free VPN cleanup.

Opensource-Setup Opensource_Setup is an interactive Python CLI tool that deploys popular self-hosted open-source services (n8n, Supabase, GitLab, Jenkins, Mattermost, and more) on any Linux server with a single command. It handles the entire deployment pipeline automatically — detecting your distro, installing Docker if missing, generating complete docker-compose files with secure random secrets, and resolving port conflicts on the fly. When deploying to a domain, it configures Caddy as a reverse proxy with automatic HTTPS and hardened security headers, requiring zero manual TLS setup. Built entirely on the Python standard library with no external dependencies, it turns hours of YAML wrangling and documentation hunting into a guided two-minute setup. Everything it generates is plain, readable, and fully yours to inspect, edit, or manage with vanilla Docker commands
